**Supplementary Information S1.**

Glossary of terminology used to define attribute states (manifest variables). Extended definitions and rationale for recording each variable are presented in Scerri et al. (2014, Supplementary Online Material).

<b>Tool laminarity</b>	-	-
<b>Tool vertical convexity</b>	-	-
<b>Lateral edge type</b>	Converging	Edges converge toward the distal end of the piece for the majority of the blank length, i.e., more than half of the length of the flake has lateral edges converging together at an angle greater than 30° from the axis of propagation (Tostevin 2011, pp. 133)
	Ovoid	Edges both expand and converge, producing rounded lateral edges, with roughly equal parts of the length of the flake having lateral edges expanding then converging (Tostevin 2011, pp. 133)
	Expanding	Edges are divergent, expanding toward the distal end of the piece for the majority of the blank length, i.e., more than half of the length of the flake has edges expanding at an angle greater than 30° from the axis of propagation (Tostevin 2011, pp. 133).
	Parallel	Edges run roughly parallel to each other along most of its length. The width remains relatively uniform from proximal (platform) to distal end (sensu Andresky 2005).
<b>Shape of distal terminus</b>	Feathered	Dorsal view of the distal end of the flake tapers to an extremely thin edge (Andresky 2005, pp. 20, 87).
	Pointed	Dorsal view of the distal end of flake is pointed i.e., the edges of the distal-most point of the blank form an angle <60° when a goniometer is placed on the distal termination. (Tostevin 2011, pp. 137; Andresky 2005, pp. 20, 87).

	Blunt	Dorsal view of the distal end of flake is blunt, i.e., the edges of the distal-most point of the blank form an angle $>60^\circ$ when a goniometer is placed on the distal termination. (Tostevin 2011, pp. 137; Andresky 2005, pp. 20, 87).
	Overshot/Plunge	A flake removal that continues past the opposite edge of the core, “plunging” across the core surface. Essentially, the flake extends so far that it removes part of the opposite margin (Andresky 2005, pp. 20, 87)
	Step	A flake whose distal end stops abruptly rather than thinning to a point, leaving a stepped or broken appearance (Andresky 2005, pp. 20, 87)
	Hinge	The flake curves downward at the distal end, creating a rounded or “hinged” look rather than a sharp point (Andresky 2005, pp. 20, 87).
<b>Curvature of the profile</b>	Straight	This attribute-state depends upon a measure of the curvature of the blank profile, i.e., the distance between the midpoint of the length on the ventral surface of the piece to the top of the table surface on which the distal and proximal tips rest. For straight profiles, this measurement does not exceed 1/8 of the blank length. Also, “straight” is chosen when the distal half twists less than 45 degrees in either direction relative to the flat profile of the platform. (Tostevin 2011, pp. 134).
	Curved	The curvature measurement exceeds 1/8 of the blank length. Also, “curved” requires that the distal half twists less than 45 degrees in either direction relative to the flat profile of the platform (Tostevin 2011, pp. 134).
	Concorde	(sensu Meignen and Bar-Yosef 1991): the distal-most 1/3 of the blank length bends down at a striking angle. This attribute-state can be subsumed under “curved” in pair-wise assemblage comparison (Tostevin 2011, pp. 134).
	Twisted	Distal tip of the piece is twisted at least 45 degrees either direction of a flat profile relative to the platform. The piece may be “curved” as well but “twisted” supersedes “curved” in the typology. (Tostevin 2011, pp. 134).
<b>Unique application of retouch</b>	Abrupt	More than $60^\circ$ (Scerri et al. 2014, SOM; Tostevin 2011, pp. 137)
	Semi abrupt	Between 30 and $60^\circ$ (Scerri et al. 2014, SOM; Tostevin 2011, pp. 137)
	Flat	Less than $30^\circ$ (Scerri et al. 2014, SOM; Tostevin 2011, pp. 137)
	Dorsal	Outer, exterior surface of the flake or tool that was once on the outside of the original stone core (Tostevin 2011, pp. 137)

	Ventral	Interior-facing side, the surface that was against the core when it was struck off. (Tostevin 2011, pp. 137)
	Bifacial	Retouch on both faces (Tostevin 2011, pp. 137)
<b>Active edge retouch type</b>	Regular	Retouch of consistent size and spacing along the active edge, creating a uniform edge.
	Irregular	Retouching that varies significantly in size, spacing, or orientation; produces a less uniform edge.
	Denticulated	Small, regular tooth-like notches along the active edge, resembling a saw (Whittaker 1994, Fig 7.20)
	Serrated	Fine, closely spaced, tooth-like retouch along the edge; can overlap with denticulated but usually smaller scale (Whittaker 1994, Fig 7.20)
	Notched	One or more distinct recesses or indentations along the edge (Whittaker 1994, pp. 129). Only considered if they are complex due to the potential of notching through taphonomic processes (Scerri et al. 2014; SOM).
	Piercer	Edge modified to form a pointed tip for piercing or perforating (Scerri et al. 2014; SOM).
	Pressure flaking	Small flakes removed by pressing rather than striking, usually for fine edge shaping (Andrefsky 2005, pp 133)
	Scalar	Retouch produces step-like removals along the edge.
	Truncation	Edge intentionally cut off or flattened to create a straight or shortened end (Scerri et al. 2014; SOM).
	Burination	A technique in which a flake or blade is struck along its edge (often the distal end) to produce a chisel-like tool, characterized by a narrow, steep, burin spall removal (Whittaker 1994, pp 118).
	<b>Inactive edge retouch type</b>	Basal thinning
Backing		Retouch along the opposite edge of a working edge to produce a blunted edge for safe handling or hafting. (Scerri et al. 2014; SOM)
Tangling		Creation of a tang (narrow stem) at the base for hafting via retouch (Scerri et al. 2014; SOM)
Notched		One or more distinct recesses or indentations along the edge (Whittaker 1994, pp. 129). Only considered if they are complex due to the potential of notching through taphonomic processes (Scerri et al. 2014; SOM).
Shouldering		Retouch creates a pronounced “shoulder” between edge and base; often to stabilize hafting (Scerri et al. 2014; SOM)
Truncation		Edge intentionally cut off or flattened to create a straight or shortened end (Scerri et al. 2014; SOM).
Burination		A technique in which a flake or blade is struck along its edge (often the distal end) to produce a chisel-like

		tool, characterized by a narrow, steep, burin spall removal (Whittaker 1994, pp 118).
