THE OCCURRENCE OF ECHIUM SABULICOLA POMEL (= E. CONFUSUM DE COINCY) IN THE MALTESE ISLANDS
Michael Brufol

ABSTRACT
The occurrence of E. sabulicola Pomel in the Maltese Islands is confirmed and its local history and status discussed.

The Lower Coralline Limestone plateau at To’ Cenc and the valley of Mgarr ix-Xini in Southern Gozo are well known for their floristic interest. The area between them, however, locally known as "Ras in-Newwielo" seems to have been unexplored. It was in this secluded locality that on April 4 1992, the writer discovered several colonies of E. sabulicola growing in crevices of friable rock on the exposed Globigerina cliff-top. The associated flora included: Anthemis urvilleana (DC) Sommier and Caruana Gatto, Damieloa melitensis (Botsch.) Brullo, Daucus rupestris Guss., Senecio leucanthemifolius Poiret, Hedysarum glomeratum F.G. Dietrich, Minuartia geniculata (Poiret) Thell., Frankenia hirsuta L., and Gynandrium sisyrinchium (L.) Parl. Some robust specimens were also seen on the edge of the adjoining follow fields, where they were also accompanied by Avena barbata Pott ex Link., Hordeum leporinum Link., Hedysarum coronarium L., and Chrysanthemum coronarium L.

E. sabulicola is a Western Mediterranean species. In Malta it was only recorded by Grech Delicoto (1853) under the name of E. maritimium Willd. from Gnejna Bay, besides Arcangeli (1894) who mentions its occurrence in the Maltese Islands, possibly on the authority of Grech Delicato. Sommier and Caruana Gatto (1915), updating the name as E. confusum De Coincy, regarded Delicato’s record as doubtful on the grounds that the latter’s sole surviving specimen at the Valletta University Herbarium was, according to them, E. arenarium Guss. This, however, is debatable. These authors observe that the roots of E. arenarium cause a violet stain on the paper on which they are mounted, giving one to understand that it is a special characteristic distinguishing E. arenarium from other Echium species. This has been proved incorrect. In fact the roots of the specimens of E. sabulicola deposited at the writer’s own herbarium caused the same violet stain. Could this erroneous assumption have influenced Sommier and Caruana Gatto in determining Delicato’s sole seventy-year-old surviving specimen? They also state elsewhere in the same publication that the old specimens deposited at the Valletta University Herbarium were not in a reliable condition for identification. In their own words: "Esso (l’Erbario Universitario di Valletta) è in pessime condizioni, e rappresenta evidentemente soltanto un residuo di quello che fu: ed anche quanto resta e' spesso inutilizzabile per trasposizioni o perdita di etichette, o perche le piante sono tante guaste da non essere riconoscibili." It is

120, Creche Street, Sliema, Malta.
improbable that Delicata could have mistaken *E. arenarium* for *E. maritimum* because he included both species in his flora together with their respective different localities and flowering periods. Both Borg (1927) and Haslam et al. (1977) include this species in their floras on the authority of Grech Delicata, the latter under the updated name of *E. sabulicola* Pomel. In the Gozo populations the writer noticed a constant morphological variation: the stamens are never exserted. In this respect the local plants are closer to *E. confusum* as described by Borg.

The present record removes any doubts there might have been on the inclusion of *E. sabulicola* Pomel as an important element in the Maltese Flora. The fact that Malta lies well within its range of distribution and its occurrence in all the nearby islands of Lampedusa, Linosa and Pantelleria suggest that it is of native origin.

ACKNOWLEDGEMENT

Thanks are due to Edwin Lonfranco of the Malta University Biology Department for confirming the writer's identification of *E. sabulicola*.
